

SilentSignal

A detailed business proposal for evidence-first banking risk operations

Governed KPI movement • Connected evidence • Honest uncertainty • Authorized action

Approve a controlled pilot that makes KPI movement decision-ready

THE PROPOSAL

Deploy SilentSignal as a non-production decision-support pilot for compliance operations.

Start with three governed sources, five connected KPIs, and two operational personas. Keep every quantitative result deterministic and every customer-impacting decision human-reviewed.

01 Faster prioritization

Move from a dashboard movement to ranked evidence and a permitted next step.

02 Safer decisions

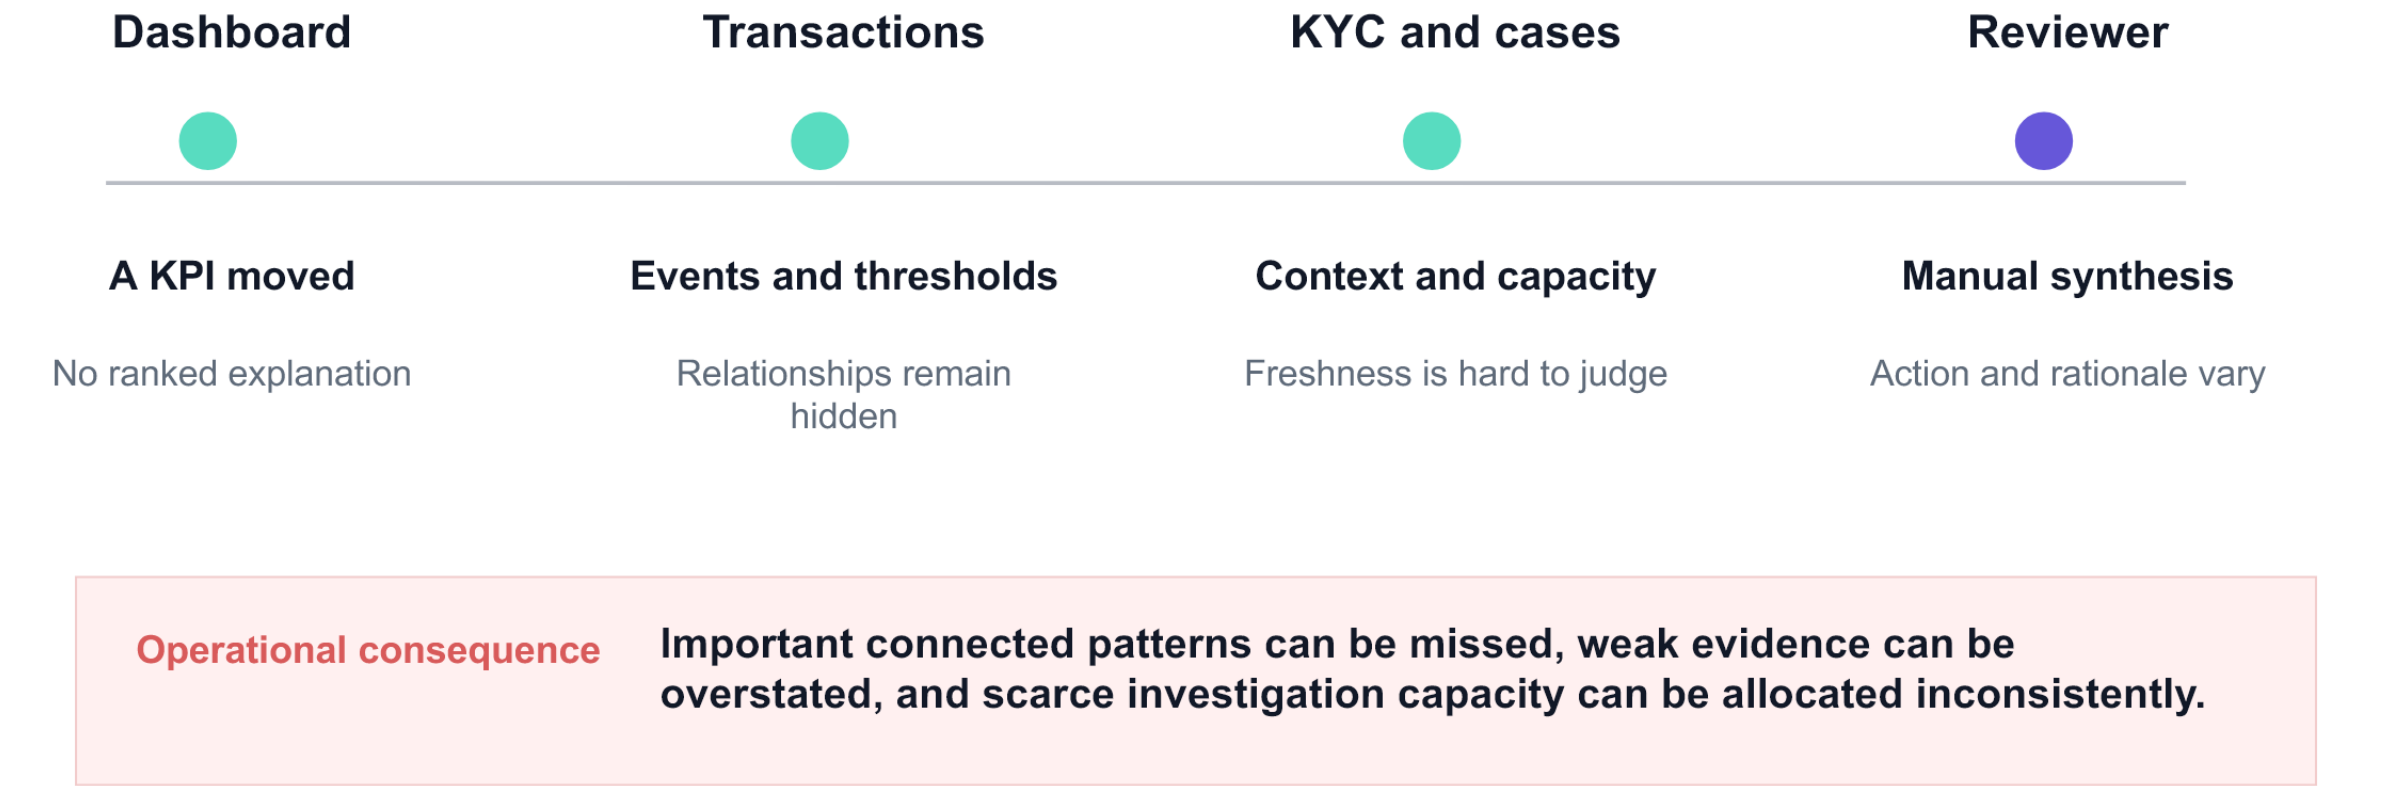

Show alternatives, missing evidence, abstention, and access restrictions before action.

03 Measurable operations

Track latency, model usage, feedback, action outcomes, and KPI impact.

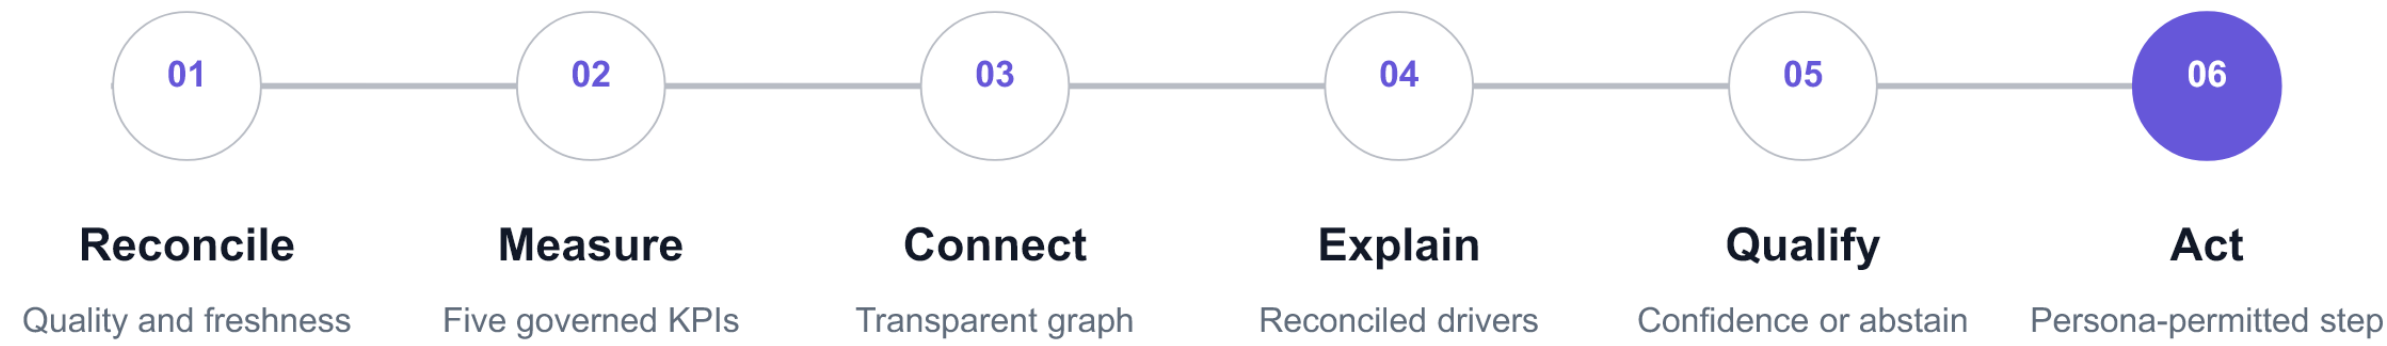

Today’s tools show signals, but leave the review decision fragmented

The information exists; the traceable path from movement to action does not.

SilentSignal turns movement into governed human action

One evidence chain replaces multiple disconnected handoffs.

Quantitative truth never leaves deterministic services; the narrative layer can only phrase validated evidence.

The same evidence supports role-specific decisions

Compliance Head

- DECISION** Which region and KPI movement should be prioritized?
- EVIDENCE** Aggregate exposure, drivers, confidence, freshness, and SLA pressure.
- PERMITTED ACTION** **Allocate capacity or request stronger evidence.**
- BOUNDARY** No entity-detail access by default.

Regional AML Investigator

- DECISION** Which assigned pattern should be investigated next?
- EVIDENCE** Masked entities, timing, branches, alternatives, and missing information.
- PERMITTED ACTION** **Consolidate events, refresh KYC, or monitor seasonality.**
- BOUNDARY** Only configured regional detail.

Three source contracts support five connected business KPIs

SOURCE	GRAIN	CADENCE	SYNTHETIC ROWS
Transactions	Transaction event	15 minutes	16,917
KYC	Account snapshot	Daily	339
Cases	Case-status event	4 hours	124

OPERATIONAL KPI JOURNEY - CONNECTED, NOT CAUSAL

Connected evidence reveals what thresholds miss

S1 - STRONG CONNECTED PATTERN

8

related new accounts

4

branches

14

days of repeated activity

WHY IT BECOMES MATERIAL

- **Repeated near-threshold activity**
Individual events sit below the illustrative threshold.
- **Shared identifiers and beneficiaries**
Transparent relationships reveal one focused component.
- **Fresh, complete evidence**
Confidence passes the gate and supports an ALERT for human review.

Threshold only	Full SilentSignal
MISSES S1	ALERT

The engine is designed to disagree, defer, or deny

Not every signal becomes an escalation.

S2 MONITOR

Seasonal activity matches expected turnover; show the legitimate alternative.

S3 ABSTAIN

Stale KYC and incomplete mapping reduce confidence below 0.60.

S4 PEER_BASED

Fourteen days of history trigger a labelled peer baseline and confidence cap.

S5 ACCESS_DENIED

A WEST investigator cannot retrieve NORTH detail; denial occurs first.

Business result: fewer unsupported escalations, clearer evidence requests, and demonstrable entitlement control.

The LLM explains evidence; deterministic services own truth

Deterministic engine - executed

- Source quality and freshness
- KPI values and baselines
- Graph and review score
- Drivers and reconciliation
- Confidence and abstention
- Authorization and action selection

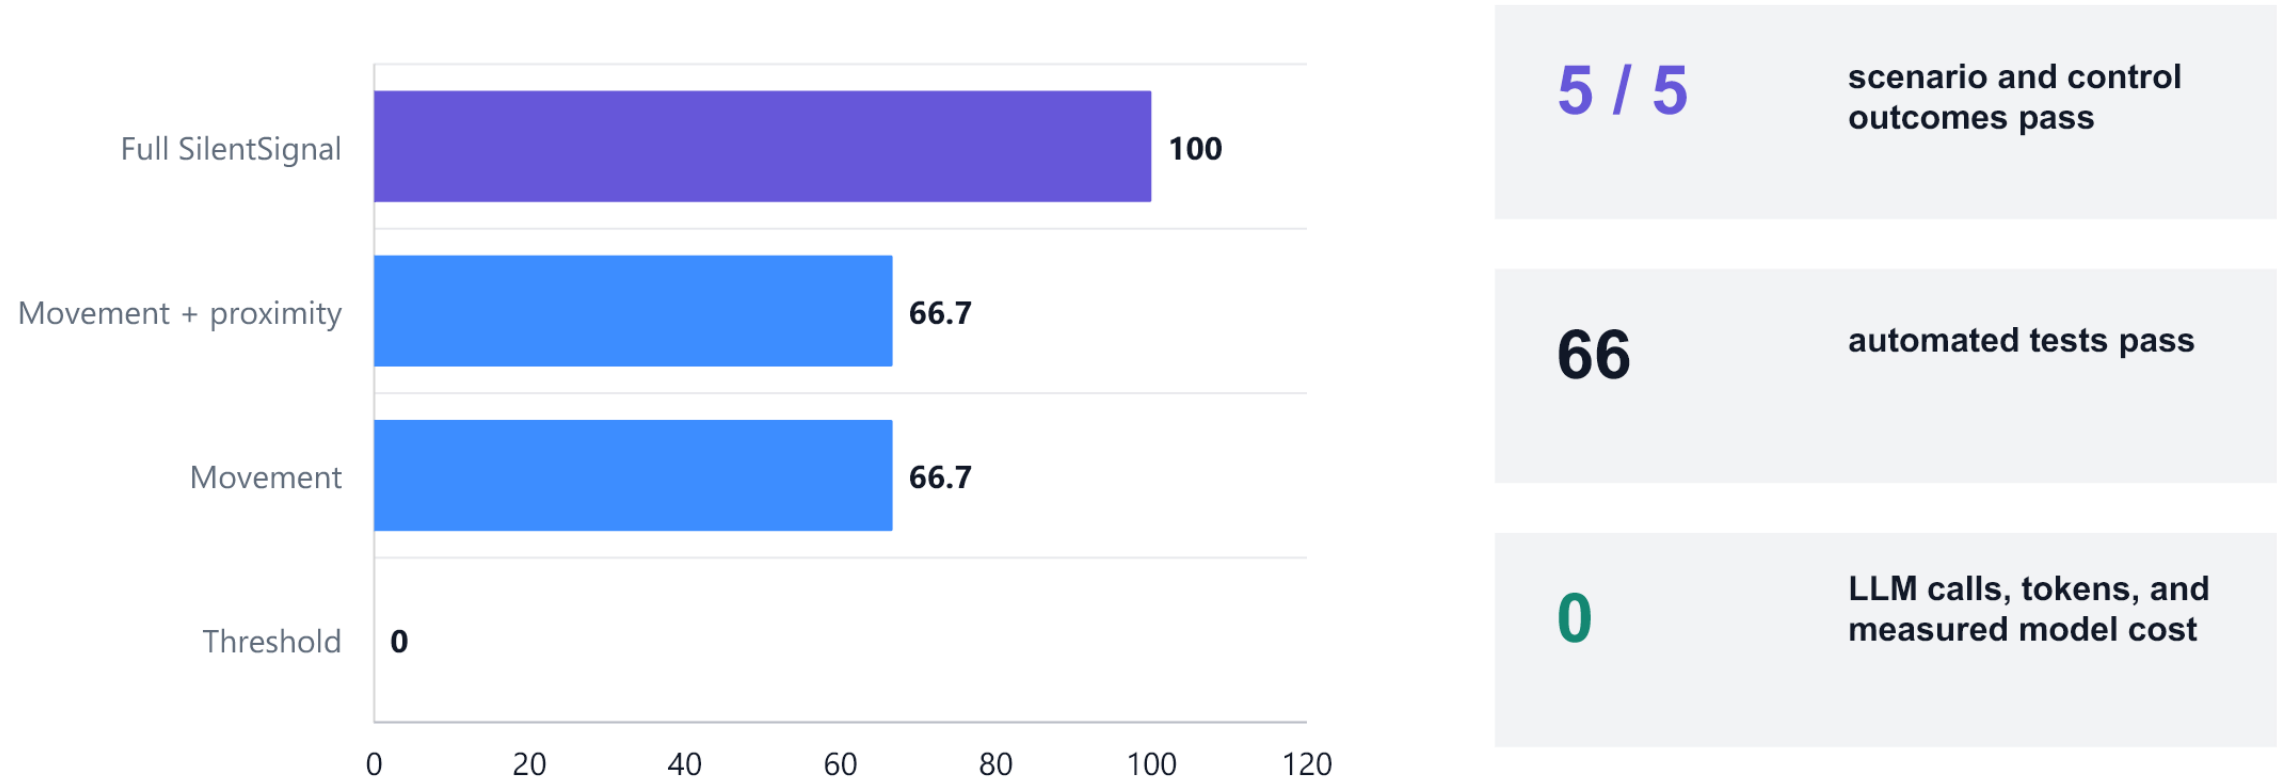

Narrative layer - optional

- Phrase a validated packet
- Adapt language by persona
- Reference approved evidence IDs
- Use a deterministic fallback
- Never receive raw identifiers
- Never choose an unapproved action

Required order: authorize -> redact -> narrate -> validate claims

The full method passes designed scenarios that simpler methods cannot

F1 ON SYNTHETIC ACCEPTANCE SET

Acceptance results prove implementation against designed ground truth - not production model accuracy.

Pilot economics can be measured without invented ROI

Use institution-approved volumes, handling costs, and control values during the pilot.

Investigator time	Cases reviewed x minutes saved per case / 60	Hours returned to risk review
False escalation	Unsupported escalations avoided x approved review cost	Avoided handling cost
SLA control	At-risk cases prevented from breaching x internal control value	Operational risk reduction

Decision rule Proceed only if measured benefit, evidence quality, security performance, and adoption all pass agreed pilot gates.

A controlled pilot tests value without widening risk

IN SCOPE

- Three non-production source extracts
- Five governed KPI contracts
- Two personas and region entitlements
- Five canonical acceptance scenarios
- Feedback, telemetry, and evaluation
- Human-approved actions only

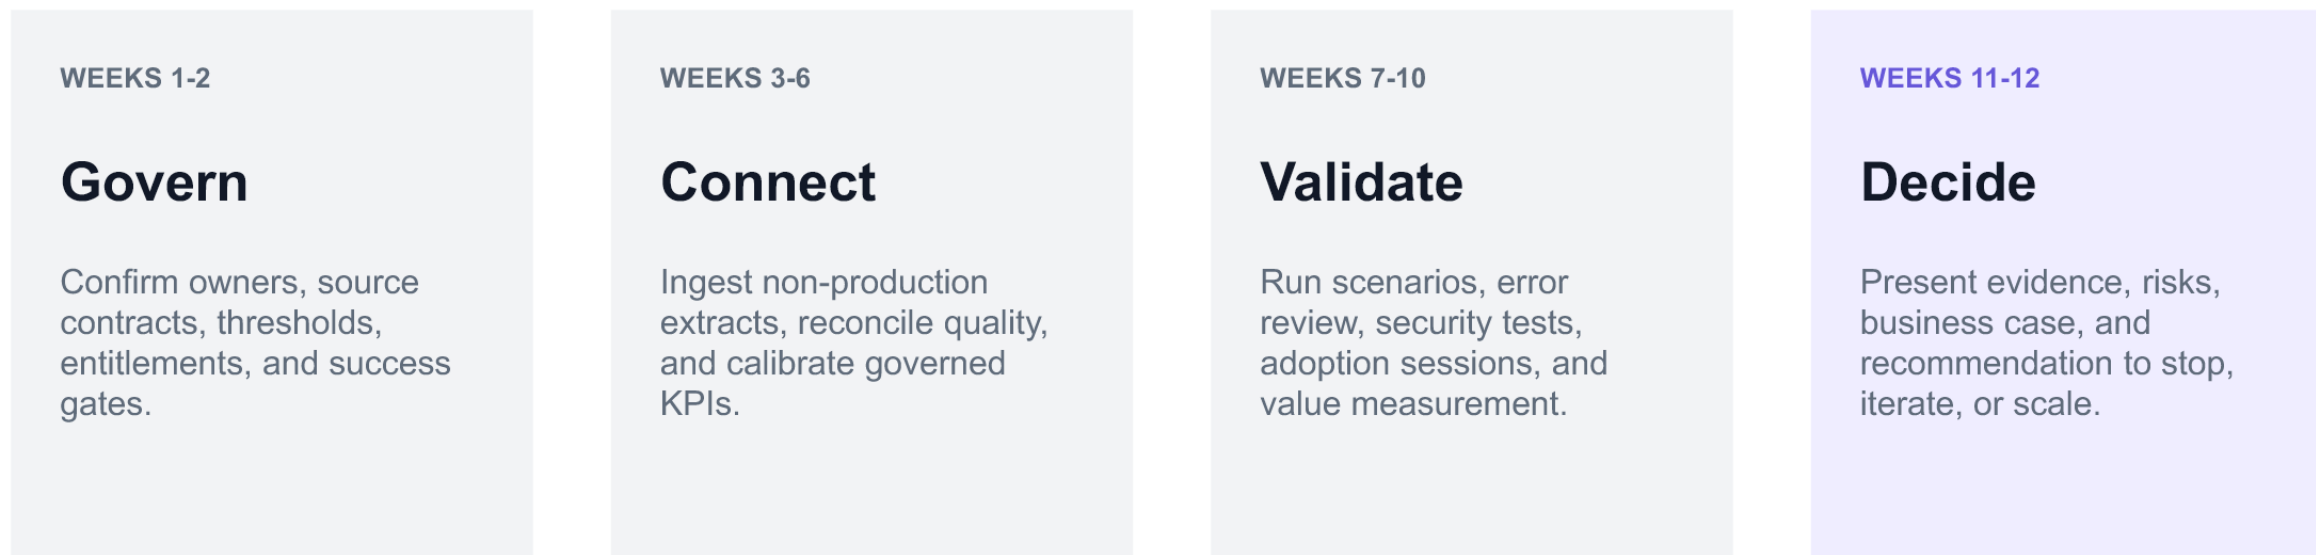

EXPLICITLY OUT OF SCOPE

- Production customer data
- Automatic STR filing or account freeze
- Autonomous case disposition
- Enterprise identity replacement
- Live streaming or core-system write-back
- Real-world accuracy claim from synthetic data

Pilot team

Executive sponsor • Compliance SME • Product owner • Data/analytics engineer • Security owner • Investigator reviewers

A twelve-week pilot moves from governance to a scale decision

Exit criteria: governed accuracy • correct abstention • zero entitlement leakage • measurable operational benefit • reviewer adoption

Approve a 12-week controlled SilentSignal pilot

Provide an executive sponsor, compliance SME time, investigator reviewers, security review, and non-production source extracts.

Pilot success means

better prioritization, provable evidence quality, correct abstention, secure role behavior, and measurable operational benefit - without autonomous customer action.

SilentSignal: governed movement -> traceable evidence -> authorized human action
